Tractable

Computer Vision • $185M raised • $1B valuation

WHO THEY ARE

Computer vision platform for auto and property damage appraisal from photos. AI-powered visual inspection used by insurers globally.

WHAT THEY DO WELL

- Best-in-class auto/property damage assessment from photos
- Marquee carriers: Tokio Marine, The Hartford, Ageas
- Global footprint — 10+ countries, proven at scale

WHERE THEY FALL SHORT

- Photos only — zero document intelligence capability
- Cannot process policy text, medical records, compliance filings, or adjuster notes
- Single use case (damage appraisal) in a multi-document workflow
- Covers <15% of the document surface area of an average P&C claim

OUR COUNTER-POSITION

"Tractable reads photos. Charterwell reads everything else. A claim isn't a photo — it's 10–15 documents. We start where Tractable stops."

PROOF POINTS

- Average P&C claim touches 10–15 documents; only 1–2 are images
- Tractable covers <15% of document surface area in a typical claim
- Claims decisions depend on policy language, medical records, and compliance — none of which are photos

TRAP QUESTIONS

- "How do you handle the police report, medical records, and policy declaration page?"
- "What happens after the damage estimate — who routes the claim, checks coverage, ensures compliance?"
- "How many document types does a typical claim involve beyond photos?"

PARTNERSHIP ANGLE

Tractable is a natural integration partner. Their damage scores feed directly into the Charterwell workspace. Complementary, not competitive — position accordingly.

Shift Technology

Fraud Detection → Claims AI • $320M raised • $1B valuation

WHO THEY ARE

AI platform built for fraud detection, now expanding into claims automation. Being acquired by Predictiv AI. 400+ insurer relationships worldwide.

WHAT THEY DO WELL

- Deep fraud detection expertise — category leader
- 400+ insurer relationships; AXA 5-year renewal (March 2026)
- Shift Claims (Sept 2025) — agentic AI with strong early metrics

WHERE THEY FALL SHORT

- DNA is analytics/decisioning, not document intelligence — fundamentally different architecture
- No workspace concept — point solution for fraud, bolting on claims
- "Document analysis" is a feature, not a platform — core was built for fraud scoring
- Predictiv AI acquisition creates roadmap uncertainty and organizational distraction

OUR COUNTER-POSITION

"Shift tells you whether a claim is suspicious. Charterwell processes the documents that make up the claim. Different problems."

PROOF POINTS

- Shift's "document analysis" is a feature, not a platform — core built for fraud
- Sub-$1B acquisition on $320M raised signals growth challenges
- Claims automation is a pivot, not their origin — depth gap vs. purpose-built solutions

TRAP QUESTIONS

- "Can Shift process a 200-page medical record and extract relevant diagnoses?"
- "How does Shift handle state-specific compliance filings?"
- "What happens to the Shift roadmap under Predictiv AI?"

COMPETITIVE RISK

Most dangerous near-term competitor. 18–24 month window to establish position before Shift builds a real document intelligence layer. Treat with urgency.

FurtherAI

Insurance AI Assistant • $30M raised (a16z) • YC-backed

WHO THEY ARE

AI assistant for insurance workflows. Backed by a16z ($30M) and Y Combinator. Broad horizontal approach to insurance automation.

WHAT THEY DO WELL

- Strong investor backing — a16z resources and distribution network
- Rapid growth trajectory as a well-funded startup
- Broad workflow coverage across insurance operations

WHERE THEY FALL SHORT

- Going wide, not deep — breadth without depth in any single domain
- No visible playbook system or structured document intelligence layer
- Fewer production deployments than incumbents or specialized players
- Generalist approach means shallower understanding of complex insurance document types

OUR COUNTER-POSITION

"FurtherAI is building an AI assistant for many insurance tasks. Charterwell is building the workspace for claims professionals. We go deep on the document layer."

PROOF POINTS

- Charterwell's doc intelligence is purpose-built for 50+ P&C document types
- FurtherAI's generalist approach = shallower understanding per document type
- Claims-specific depth requires insurance domain expertise, not general AI breadth

TRAP QUESTIONS

- "Can you show me FurtherAI on a complex BI claim with 50+ pages of medical records?"
- "How does extraction accuracy compare on insurance-specific docs vs. generic PDFs?"
- "How many insurance document types does FurtherAI understand at a structural level?"

COMPETITIVE RISK

Primary competitive threat. a16z resources + distribution create real market pressure. Speed to market is critical — they will close the depth gap over time.

Hyperscience

Horizontal IDP • $300M+ raised • 99.5% extraction accuracy

WHO THEY ARE

Horizontal intelligent document processing (IDP) platform. Enterprise-grade extraction used across financial services, government, and insurance.

WHAT THEY DO WELL

- Proven accuracy — claims 99.5% extraction rate
- Enterprise customers: AmEx, Schwab, SSA, VA
- 85% processing time reduction for a top-10 insurer

WHERE THEY FALL SHORT

- Horizontal platform — no insurance-specific intelligence built in
- Doesn't understand coverage types, adjudication rules, or state compliance
- Extraction tool, not a workspace — data out, not decisions made
- Cannot determine coverage, route adjusters, or check 50-state compliance requirements

OUR COUNTER-POSITION

"Hyperscience extracts data from documents. Charterwell understands what that data means for your claim."

PROOF POINTS

- IDP accuracy is table stakes — the value is the insurance intelligence layer on top
- Generic IDP can't determine coverage, route adjusters, or check 50-state compliance
- Extraction without domain understanding still requires manual review for every decision

TRAP QUESTIONS

- "Can Hyperscience determine whether a claim falls within policy coverage?"
- "How does it handle state-specific compliance for PA vs. CA?"
- "Does it route claims to the right adjuster based on document content?"

Guidewire / Duck Creek

Core P&C Platforms • GW: $1.2B rev, 19% ARR growth • DC: Vista-owned

WHO THEY ARE

Legacy core P&C platforms — systems of record for policy, billing, and claims administration. Guidewire is public ($1.2B rev); Duck Creek is Vista Equity-owned.

WHAT THEY DO WELL

- Massive installed base with deep carrier integration
- Multi-year lock-in contracts — Liberty Mutual 10-year cloud deal
- Adding AI capabilities to existing platform (bolted-on, but present)

WHERE THEY FALL SHORT

- Legacy architecture with AI bolted on — not AI-native
- $5–50M+ implementations taking 12–24 months — slow and expensive
- Manage claim records, not claim documents — data in fields, not intelligence from content
- AI enhancements constrained by decades-old data models and workflows

OUR COUNTER-POSITION

"Guidewire is your system of record. Charterwell is your system of intelligence. We don't replace your core — we make it smarter."

PROOF POINTS

- Guidewire implementation: $5–50M+, 12–24 months
- Charterwell pilot: 60–90 days, measurable ROI
- Sits alongside existing core — not a rip-and-replace

TRAP QUESTIONS

- "How long did your last Guidewire enhancement take?"
- "Can Guidewire AI process a handwritten police report?"
- "How many AI tools run alongside Guidewire today? How well do they integrate?"

PARTNERSHIP ANGLE

Guidewire integration is a Day 1 priority. Every Guidewire carrier is a Charterwell prospect. Position as complementary — the intelligence layer that makes their existing investment smarter.

"We'll Build It In-House"

Internal Engineering / Innovation Team

WHO THEY ARE

The carrier's internal engineering or innovation team — ambitious, well-resourced, but facing a specialized problem they underestimate.

WHAT THEY DO WELL

- Full data control — no vendor dependency
- Deep internal workflow knowledge and institutional context
- Internal buy-in and executive sponsorship (initially)

WHERE THEY FALL SHORT

- 88% of carriers want to build AI — only 7% have scaled it to production
- Requires specialized document understanding across 50+ P&C document types
- 50-state compliance is a moving target that demands continuous model updates
- 18–24 months to production with high failure rate — executive patience runs out

OUR COUNTER-POSITION

"88% want to build. 7% succeed. The gap isn't ambition — it's the specialized AI expertise that insurance documents demand."

PROOF POINTS

- Internal AI build: 18–24 months to production, high failure rate
- Charterwell pilot: 60–90 days with measurable ROI
- Doc engine already understands 50+ P&C document types on day one

TRAP QUESTIONS

- "How many of your AI pilots have made it to production?"
- "What's your timeline for all document types across all claim types?"
- "Who on your team has built insurance-specific document intelligence before?"
